

1. Background

This revised Figure 11 presents a stacked bar chart showing container volumes (in thousands of TEUs) from 2019 through January–July 2025. The figure now incorporates patterned fills—such as crosshatching, diagonal striping, and checkerboard patterns—to match the accessibility improvements applied in Figure 12. These patterns increase visual distinction between categories that rely on similar hues.

2. Text Contrast

White labels and gridlines remain highly visible against the black background. Legend text is readable and separated clearly from patterns within the bars. No segment-level text appears inside the bars, maintaining strong clarity throughout.

3. Graphic (Slice) Contrast

Contrast between slices has been significantly improved with the introduction of patterns. Previously ambiguous regions—especially where multiple blues and grays were adjacent—are now visually distinct. Patterns provide a strong, non-color separation mechanism, helping users identify segments even where colors are similar in luminance.

4. Color-Blind Safety

This updated figure offers major enhancements for color-blind accessibility. The use of consistent, distinguishable hatch patterns ensures viewers with red–green, blue–yellow, or full-spectrum deficiencies can differentiate stacked categories. This aligns with ADA and WCAG guidelines that require non-color encoding for meaningful

differences. Nearly all potential conflict colors now have pattern redundancy, improving comprehension for all users.

5. OCR / Text Size

Axis labels, legend labels, and tick marks remain readable and large enough for OCR extraction. The use of patterns does not introduce noise that would interfere with text recognition, as text remains outside the data regions. OCR systems should reliably capture all textual content.

6. Blur & DPI

The figure renders cleanly, with crisp edges and stable pattern definition. Checkerboard and diagonal lines maintain sharpness at this resolution. For printing or accessibility documentation, exporting at ≥ 300 DPI is recommended to prevent pattern moiré effects or edge softness.

7. Alt Text Recommendation

“ Updated stacked bar chart showing container volumes in thousands of TEUs from 2019 to January–July 2025. Port categories now include distinct hatch patterns to increase accessibility and reduce reliance on color. Volumes peak around 2019–2020, decline through 2021–2022, rise in 2023–2024, and decrease again in early 2025. ”
