

1. Background

This updated figure is a stacked bar chart showing annual container volumes (in thousands of TEUs) from 2019 through January–July 2025. Several categories now use hatched fill patterns to improve visual distinction and accessibility.

2. Text Contrast

White axis labels and gridlines on a black background provide strong contrast. Patterned fills do not interfere with text readability since labels remain outside the bars.

3. Graphic (Slice) Contrast

Hatched fills for ports such as Houston, Oakland, and Savannah enhance separation between categories, especially where colors are similar. Patterns improve visibility in thin stacked slices.

4. Color-Blind Safety

The addition of hatching significantly improves accessibility by providing redundant encoding. Users with red–green or blue–yellow color blindness can now differentiate several categories without relying solely on hue.

5. OCR / Text Size

Text is sufficiently large for OCR extraction. Patterns do not affect OCR suitability because no text is embedded within bar segments.

6. Blur & DPI

The updated figure remains sharp and clear. Hatched patterns render cleanly at this resolution. For print or accessibility distribution, ≥ 300 DPI is recommended.

7. Alt Text Recommendation

“ Updated stacked bar chart showing annual container volumes in thousands of TEUs from 2019 to January–July 2025. Several ports now use hatched fill patterns alongside original colors to improve accessibility. Total volumes peak around 2019–2020, drop in 2021–2022, rise again in 2023–2024, and decline in early 2025. ”
