

1. Background

This figure is a stacked bar chart showing annual container volumes (in thousands of TEUs) from 2019 through January–July 2025. Each bar represents total throughput distributed across major U.S. ports including Charleston, Los Angeles, New York/New Jersey, Houston, Long Beach, NWSA, Oakland, Virginia, and Savannah. The visualization highlights trends and variation in port activity over time.

2. Text Contrast

The chart uses white labels (axis text, legend, titles) against a black background. This yields strong contrast and enhances legibility for most users. Some thinner white gridlines and small tick labels may still pose readability challenges, but overall contrast performance is high.

3. Graphic (Slice) Contrast

Each port is represented using a different color in the stacked columns. Several colors contrast clearly, but some combinations—particularly similar shades—may blend visually for users with low vision. Thin slices (representing smaller contributions) are especially hard to differentiate due to limited on-bar spacing.

4. Color-Blind Safety

The chart relies entirely on color to encode port identity, without patterns or textures. With many ports represented, several colors overlap in hue or luminance, making them difficult to distinguish for viewers with red–green or blue–yellow color blindness. Stacked bars intensify this challenge because adjacent segments require precise color differentiation.

5. OCR / Text Size

Most visible text—including axis labels and year labels—is large enough for OCR extraction. However, the legend text, while readable, may pose OCR challenges due to color coding without accompanying text redundancy. Small segment-level differences cannot be parsed by OCR due to lack of numeric labels on the bars.

6. Blur & DPI

The image is clear and free from blur or compression artifacts. Thin lines, including stacked segment boundaries and gridlines, render well. Some small segments may lose clarity in low-resolution printing. A DPI of ≥ 300 is recommended for producing high-quality accessible versions.

7. Alt Text Recommendation

A recommended 508-compliant alt text description: “ Stacked bar chart illustrating annual container volumes from 2019 to January–July 2025, measured in thousands of TEUs. Bars show combined throughput for major U.S. ports including Charleston, Los Angeles, New York/New Jersey, Houston, Long Beach, NWSA, Oakland, Virginia, and Savannah. Total volumes peak around 2019–2020, decline through 2021–2022, rise again in 2023–2024, and decrease in early 2025. ”
