

1. Background

This figure is a stacked bar chart showing annual TEU container volumes (in millions) for major U.S. ports from 2019 to January–July 2025. The bars represent combined throughput across multiple ports including Los Angeles, Long Beach, New York/New Jersey, Houston, NWSA (Seattle & Tacoma), Charleston, Oakland, Virginia, and Savannah.

2. Text Contrast

Axis labels, tick labels, and gridlines are displayed in white against a black background, producing strong contrast and good legibility. Legend text is also white and readable. However, the brightness difference between the chart background and some lighter stacked segments may cause slight visual blending for low-vision users.

3. Graphic (Slice) Contrast

The stacked bars use a multi-color palette where several segments share similar midtone hues (multiple blues and grays). While visually distinguishable, thin slices remain difficult to interpret, especially when colors are close in brightness. The lack of patterns means segment identity relies solely on color differences.

4. Color-Blind Safety

Because the visualization uses many color categories without patterns, users with red–green or blue–yellow color blindness may struggle to distinguish several segments. Blues, greens, and grays appear especially similar under common color-vision deficiencies. The stacked format intensifies this issue, as adjacent colors require precise discrimination.

5. OCR / Text Size

Text used for axis labels, year labels, and legend entries is sufficiently large for OCR extraction. No text appears inside the bars, which improves OCR compatibility. Year labels may be slightly small but remain readable in this resolution.

6. Blur & DPI

The overall figure is crisp, with clean bar boundaries and readable text. Minor blur may occur in thinner stacked slices if the graphic is printed or compressed. For archival or accessibility use, exporting at ≥ 300 DPI is recommended to preserve edge clarity and color fidelity.

7. Alt Text Recommendation

A recommended 508-compliant alt text description: “ Stacked bar chart showing annual container volumes in millions of TEUs from 2019 to January–July 2025. Each stacked bar represents contributions from major U.S. ports including Los Angeles, Long Beach, New York/New Jersey, Houston, NWSA, Charleston, Oakland, Virginia, and Savannah. TEU volumes rise in 2021–2022, fall in 2023, rebound in 2024, and decrease again in early 2025. ”
