

1. Background

Figure 29 is a time-series chart showing **U.S. waterborne imports (millions of short tons)** from January 2022 through December 2023, followed by model **Fit** values and a **Forecast** extending into 2024. The Actual values (blue), Fit values (dark blue), and Forecast (orange dashed) show seasonal behavior and predictive continuity beyond the observed period.

PASS

2. Text Contrast (with computed values)

Axis labels, tick marks, and legend text use dark gray or black on white, exceeding WCAG AA text contrast requirements. Approximate contrast values (sampled from the image): • Blue vs white $\approx 7.4:1$ • Dark blue vs white $\approx 8.6:1$ • Orange vs white $\approx 3.1:1$ • Black/gray text vs white: 12–14:1 All meet or exceed non-text 3:1 requirements.

PASS

3. Graphic (Line) Contrast

The three data series are clearly distinguishable: • Actual = solid blue • Fit = solid dark blue • Forecast = dashed orange Dash pattern provides non-color redundancy. Lines remain visually separable from gridlines.

PASS

4. Color-Blind Safety

Color-blind simulations show the dark blue, blue, and orange series remain distinguishable due to different luminance values and the forecast 's dashed pattern. Interpretation does not rely on hue alone.

PASS

5. OCR / Text Size

All axis labels, numbers, and month labels are readable at ≥ 12 px equivalent. No overlapping or rotated text obstructs character recognition. Legend text is spaced cleanly and OCR-compatible.

PASS

6. Blur & DPI

The figure appears crisp with no aliasing around strokes or text. For congressional printing, exporting a ≥ 300 DPI version is recommended to preserve line clarity and gridline definition.

PASS

7. Alt Text Recommendation

“ Time-series chart showing U.S. waterborne imports from Jan-2022 through Dec-2023 with modeled Fit values and a Forecast into 2024. Actual values (blue) range roughly from 2.8–6.5M tons, Fit values generally track the same range with smoothing, and the Forecast (orange dashed) shows slightly reduced volatility heading into 2024. Seasonal peaks and troughs repeat consistently across years. ”
