

1. Background

This updated figure is a pie chart showing regional distribution percentages among East, Great Lakes, Gulf, Inland, Oconus, and West. East represents the largest share at 45%, West is 37%, Gulf is 11%, Oconus is 7%, while Inland and Great Lakes show 0%. The updated styling aligns this figure with consistency standards applied to the other regional pie charts.

2. Text Contrast

Black text labels placed outside the slices maintain excellent contrast against the white background. The “ Gulf 11% ” label inside the dark blue slice remains readable due to sufficient luminance difference. The updated figure continues to avoid placing black text directly onto light yellow or light teal areas, ensuring better visual contrast overall.

3. Graphic (Slice) Contrast

Color and pattern contrast remain strong. East uses a saturated teal fill, Gulf uses dark blue, Oconus uses yellow, and West uses horizontal gray striping. These visual encodings successfully differentiate slices. Zero-value slices (Inland and Great Lakes) appear as very thin wedges but are still labeled outside the chart to ensure clarity.

4. Color-Blind Safety

The continued use of patterning for West greatly enhances accessibility for users with color-vision deficiencies. East (teal) and Gulf (dark blue) remain distinguishable through luminance differences. Yellow (Oconus) may be less distinguishable under blue-yellow color blindness, but overall the combination of color + pattern provides moderate-to-strong accessibility support.

5. OCR / Text Size

The labels and percentages remain sufficiently large for reliable OCR extraction. The “ Gulf 11% ” label inside the slice may present moderate OCR difficulty due to placement over a colored background but remains readable for viewers. Zero-value categories are correctly identified with external labels, preventing misinterpretation by OCR systems.

6. Blur & DPI

The updated image is clear, with crisp boundaries around slices and patterns. The horizontal striping in the West region remains legible and consistent. No compression artifacts or pixelation are visible. For printing or archival use, exporting the image at ≥ 300 DPI is recommended for optimal accessibility and retention of fine details.

7. Alt Text Recommendation

A recommended 508-compliant alt text description: “ Pie chart showing regional distribution: East 45%, West 37%, Gulf 11%, Oconus 7%, Inland 0%, and Great Lakes 0%. East is shown in teal, West in gray stripes, Gulf in dark blue, Oconus in yellow, while Inland and Great Lakes appear as minimal slices. The figure is visually consistent with other regional distribution charts. ”
