

1. Background

This figure is a pie chart showing regional distribution percentages for East, Great Lakes, Gulf, Inland, Oconus, and West. The chart uses a combination of solid colors, patterns, and labels to distinguish each region. East represents the largest share at 45%, followed by West at 37% and Gulf at 11%.

2. Text Contrast

Labels and percentages appear in black text against a white background, providing strong contrast and legibility. Text placed over colored slices (such as the Gulf value) generally maintains readability due to sufficient contrast, though white text on the dark blue Gulf slice is slightly lower in contrast but still acceptable for accessibility.

3. Graphic (Slice) Contrast

The chart uses several differentiators: solid teal for East, dark blue for Gulf, yellow for Oconus, striped gray for West, and a small white wedge for Inland. Three regions (Great Lakes, Inland, Great Lakes 0%) appear at very small or zero proportions, making them nearly invisible. The striped pattern for West provides a non-color differentiator that enhances accessibility.

4. Color-Blind Safety

The use of patterns significantly improves accessibility for users with color-vision deficiencies. West (gray stripes) remains distinguishable even under red–green or blue–yellow color blindness. Gulf and East are distinct due to differing luminance. However, Oconus (yellow) may blend visually for some users with blue–yellow deficiencies. Overall, this chart provides moderate-to-strong color-blind support due to mixed encoding methods.

5. OCR / Text Size

Labels and percentages outside the chart are adequately sized and should OCR cleanly. The “ Gulf 11% ” label within the slice may be more difficult for OCR systems due to placement within a dark region but remains readable for humans. Zero-value slices do not contain labels, which prevents OCR confusion.

6. Blur & DPI

The figure is crisp, with clean edges on the patterned West region and solid slices. No visible blurring or pixelation is present. Very fine striping in the West wedge may soften slightly under heavy compression or low-resolution printing. Recommended final export is ≥ 300 DPI for accessibility and clarity.

7. Alt Text Recommendation

A recommended 508-compliant alt text description: “ Pie chart showing regional distribution: East 45%, West 37%, Gulf 11%, Oconus 7%, Inland 0%, and Great Lakes 0%. East is shown in teal, West in gray stripes, Gulf in dark blue, and Oconus in yellow. Inland and Great Lakes appear as negligible or zero-value slices. ”
